The SEAMOR ROV Proves to be a Key Tool in Critical Search and Recovery Missions

When the **Legacy Water Search & Recovery Society** needed a **reliable** and **easy-to-use** system for **underwater searches and recoveries**, they turned to **SEAMOR ROV** for help.

Search and recovery work is emotionally and technically challenging: working for **long hours** in **difficult terrain** and in a **wide range of underwater conditions** to recover the remains of drowning victims. The Legacy Water Search & Recovery Society team members are called on to find clues or determine the location where a victim may have disappeared days, weeks or even years after their accidents in hopes to help solve missing person cases and bring closure to the families left behind. Divers often cannot safely access sites where accidents have happened, and cannot operate for the long hours required to conduct these kinds of searches.

The **SEAMOR Chinook** was **the ROV of choice** for this type of work: **easy to deploy, maneuverable, and compatible with a variety of side-scan sonar units** that can be integrated into the system by the engineering team at SEAMOR. The ROV came with **two rear thrusters** and was also equipped with a **Tritech MicroNav** which mounts on the vehicle and provides **acoustic underwater navigational system**.

SEAMOR ROVs are relied upon to help with critical work by the Legacy Water Search & Recovery Society and many other search and recovery agencies across the world.
